But what do I need to do to participate?
Linking Publications to Data and Software

TL;DR

Crossref and Datacite provide a service to link publications and data. The easiest way for Crossref members to participate in this is to cite data using DataCite DOIs and include them in the references within the metadata deposit. These data citations are automatically detected. Alternatively and/or additionally, Crossref members can deposit data citations (regardless of identifier) as a relation type in the metadata. Data & software citations from both methods are freely propagated. This helps to establish the relationship between articles and data.
Cite data using DataCite DOIs and include them in references within Crossref metadata deposits
and/or
Include data citations (regardless of identifier) as a relation type in your Crossref metadata deposits.
Thank You
